ABSTRACT OF THE DISCLOSURE

A toner is proposed which includes toner particles and a fluidity-imparting agent and which has characteristics that when 100 g of the toner is sieved with a 500-mesh sieve, the residue of the toner on the sieve has a circularity of from 0.93 to 0.97 and a weight not greater than 10 mg. The toner is for use in an electrophotographic image formation method using an intermediate image transfer method. A full-color image formation method, using this toner, and an image formation apparatus in which this toner is used are also proposed.
